

## Task 10. Ariel

Implement Weather application using <http://api.dev.accuweather.com/developers/> API.

1. On start app should show screen with forecast at current location.
2. Also app should have possibility to add cities.
3. As an example for UI use standard iOS Weather App. (UICollectionView view for hour forecast, tableView for daily forecast).
4. For the first version of app use standart iOS classes for networking (Connection, Session etc.)
5. When first version is done, be ready to create another branch and replace network layer with Alamofire library.
6. Do not forget that we work with network in background thread.
